## TESTING CHEBYSHEV'S BIAS FOR PRIME NUMBERS UP TO 5* $\mathbf{1 0}^{15}$

Andrey Sergeevich SHCHEBETOV<br>Lomonosovskaya School<br>Moscow, Russia

Presentation for The Intel International Science and Engineering Fair
Intel ISEF 2019
Phoenix, Arizona
May 12-17, 2019

## GOALS AND TARGETS FOR THE PROJECT

- To test Chebyshev's Bias for 15 "most biased prime number races"
- To extend the range tested by mathematicians 5000 times to $5 * 10^{15}$ $\left(5 * 10^{15}\right.$ - the upper bound and the last number of the tested range)
- To define exactly the main characteristics of all sign-changing zones (known, as well as newly found), including their beginning, end and number of terms
- To check newly discovered zones against predictions
- To test and confirm all previously known sign-changing zones for $\Delta_{q, a, b}(x)$ up to $10^{12}$
- To make all primary data available to a wide group of mathematicians working in number theory field through OEIS publication and deposit in author's own repository
- To define all data in a uniform way and with unified format

The main goal of the project was to test Chebyshev's Bias for 15 selected moduli and pairs of residues for prime numbers up to $5 * 10^{15}$.

## LETTER FROM CHEBYSHEV TO FUSS (1853)

СОчиненІя
І. Л. पЕБЫШIIEВА,

- 698 -

Chebyshev's Bias (Chebyshev, 1853). "There is a notable difference in the splitting of the prime numbers between the two forms $4 n+3,4 n+1$ : the first form contains a lot more than the second."

In 1853 Chebyshev suggested that there are always more primes of the form $4 n+3$ than primes of the form $-4 n+1$.

## CHEBYSHEV'S BIAS FOR TWO RESIDUES

$\pi(x)=\pi_{4,3}(x)+\pi_{4,1}(x)+1$
$\Delta_{4,3,1}(x)=\pi_{4,3}(x)-\pi_{4,1}(x)$
$\pi(x)$ - prime counting function
$q=4$-modulus
$a=3$ and $b=1$-residues
$(a, q)=1,(b, q)=1$

Chebyshev's Bias(1853): $\Delta_{4,3,1}(x)>0$ for all $x$

- Initial conjecture for $q=4, a=3, b=1$
- Similar situation for $q=3, a=2, b=1$
- «Prime number races»

Chebyshev's Bias is easily formulated through prime counting function for two residues a and b modulo $q$.

CHEBYSHEV'S BIAS EXAMPLE FOR TWO RESIDUES MOD 4

| $x$ | $\pi(\mathrm{x})$ | $\#\{4 n+2\}$ | \# $\{4 \mathrm{n}+3$ \} | $\#\{4 n+1\}$ | $\Delta\{4,3,1\}$ | \% |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 100 | 25 | 1 | 13 | 11 | 2 | 2.000\% |
| 200 | 46 | 1 | 24 | 21 | 3 | 1.500\% |
| 300 | 62 | 1 | 32 | 29 | 3 | 1.000\% |
| 400 | 78 | 1 | 40 | 37 | 3 | 0.750\% |
| 500 | 95 | 1 | 50 | 44 | 6 | 1.200\% |
| 600 | 109 | 1 | 57 | 51 | 6 | 1.000\% |
| 700 | 125 | 1 | 65 | 59 | 6 | 0.857\% |
| 800 | 139 | 1 | 71 | 67 | 4 | 0.500\% |
| 900 | 154 | 1 | 79 | 74 | 5 | 0.556\% |
| 1000 | 168 | 1 | 87 | 80 | 7 | 0.700\% |
| 2000 | 303 | 1 | 155 | 147 | 8 | 0.400\% |
| 3000 | 430 | 1 | 218 | 211 | 7 | 0.233\% |
| 4000 | 550 | 1 | 280 | 269 | 11 | 0.275\% |
| 5000 | 669 | 1 | 339 | 329 | 10 | 0.200\% |
| 6000 | 783 | 1 | 399 | 383 | 16 | 0.267\% |
| 7000 | 900 | 1 | 457 | 442 | 15 | 0.214\% |
| 8000 | 1007 | 1 | 507 | 499 | 8 | 0.100\% |
| 9000 | 1117 | 1 | 562 | 554 | 8 | 0.089\% |
| 10,000 | 1229 | 1 | 619 | 609 | 10 | 0.100\% |
| 20,000 | 2262 | 1 | 1136 | 1125 | 11 | 0.055\% |

- The phenomena is small, but permanent
- Effective percentage has tendency to decrease
- At Chebyshev's times and 100 years after no negative zones for $\Delta_{4,3,1}$ were known
- Only in 1957 the first and the second zones were discovered

The first and second zones where Chebyshev's Bias was violated were discovered only in 1957-more than 100 years after the letter to Fuss.

## MAIN WORKS IN CHEBYSHEV'S BIAS AREA

1853 Letter from P.L. Chebyshev to P.N. Fuss
1914 J. E. Littlewood, «Sur la distribution des nombres premiers»
1957 J. Leech, «Note on the distribution of prime numbers»
1959 D. Shanks "Quadratic Residues and the Distribution of Primes»
1962 S. Knapowski and P. Turán, «Comparative Prime-Number Theory"
1978 C. Bays u R. Hudson, «Details of the first region of integers $x$ with $\pi\{3,2\}(x)<\pi\{3,1\}(x)$ »
1978 R. H. Hudson u C. Bays, «The appearance of tens of billion of integers $x$ with $\pi\{24,13\}(x)<\pi\{24,1\}(x)$ in the vicinity of $10^{\wedge} 12$ »
1979 C. Bays u R. H. Hudson, «Numerical and graphical description of all axis crossing regions for the moduli 4 and 8 which occur before 10^12"
1994 M. Rubinstein u P. Sarnak, «Chebyshev's Bias"
2001 C. Bays, K. Ford, R. H. Hudson u M. Rubinstein, «Zeros of Dirichlet L-functions near the Real Axis and Chebyshev's Bias»
2001 K. Ford u R. H. Hudson, «Sign changes in pi\{q;a\}(x) - pi\{q;b\}(x)»
2006 A. Granville u G. Martin, «Prime Number Races»
2012 G. Martin u J. Scarfy, "Comparative Prime Number Theory"
2013 D. Fiorilli u G. Martin, «Inequities in the Shanks-Renyi prime number race: an asymptotic formula for the densities"
"Chebyshev's conjecture was the origin for a big branch of modern Number Theory, namely, comparative prime-number theory» as was written by S.V. Konyagin (Russia) and K. Ford (USA) in a joint paper.

## CHEBYSHEV'S BIAS AND OTHER THEOREMS

Dirichlet prime number theorem for arithmetic progression (Dirichlet, 1837). Let a, q $\in Z^{+}$be such that $\operatorname{gcd}(a, q)=1$. Then there are infinitely many prime numbers $p$ such that $p \equiv a(\bmod q)$. Therefore, as a result:

$$
\frac{\#\{\text { primes } q n+a \leq x\}}{\#\{\text { primes } q n+b \leq x\}} \rightarrow 1(a s x \rightarrow \infty)
$$

Theorem (Littlewood, 1914). There are arbitrarily large values of x for which there are more primes of the form $4 n+1$ up to $x$ than primes of the form $4 n+3$. In fact, there are arbitrarily large values of $x$ for which:

$$
\#\{\text { primes } 4 n+1 \leq x\}-\#\{\text { primes } 4 n+3 \leq x\} \geq \frac{1}{2} \frac{\sqrt{x}}{\ln x} \ln \ln \ln x
$$

Conjecture (Knapowski and Turán, 1962). As $X \rightarrow \infty$, the percentage of integers $x \leq X$ for which there are more primes of the form $4 n+3$ up to $x$ than of the form $4 n+1$ goes to $100 \%$.

Theorem (Kaczorowski, Rubinstein-Sarnak, 1994). If the Generalized Riemann Hypothesis GRH is true, then the Knapowski-Turán Conjecture is false.

The connection between Chebyshev's Bias and Generalized Riemann Hypothesis (GRH) was proven in 1994.

## CHEBYSHEV'S BIAS AND OTHER THEOREMS

Generalized Riemann Hypothesis (GRH) (Piltz, 1884): For any $\chi$ mod $q$ and all complex $s=\sigma+$ it such as $0 \leq \sigma \leq 1$ and $L(\sigma+i t, \chi)=0$, all the non-trivial zeroes of the
Dirichlet L-function $L(s, \chi)(\operatorname{Re}(s)>1)$ lie on the straight line $\operatorname{Re}(s)=1 / 2$.

$$
L(s, \chi)=\sum_{n=1}^{\infty} \frac{\chi(n)}{n^{s}}=\prod_{\text {pprimes }}\left(1-\frac{\chi(p)}{p^{s}}\right)^{-1}
$$

Dirichlet L-function for "race of primes $4 n+3 v s$. primes $4 n+1$ " $(\operatorname{Re}(\mathrm{s})>1)$ :

$$
L(s)=\frac{1}{1^{s}}-\frac{1}{3^{s}}+\frac{1}{5^{s}}-\frac{1}{7^{s}}+\frac{1}{9^{s}}-\frac{1}{11^{s}}+\cdots
$$

Therefore, the sum over primes in arithmetic progression is equivalent to the sum over zeros of Dirichlet L-function.
Rubinstein and Sarnak (1994): The sum over primes in arithmetic progressions results into:

$$
\sum_{k \geq 1} \sum_{\substack{k \leq x \\ p^{k} \equiv a \bmod q}} \frac{1}{k}=\pi(x ; q, a)+\frac{1}{2}\left|\left\{p \leq \sqrt{x}: p^{2} \equiv a \bmod q\right\}\right|+\text { error }
$$

The second term in the formula is the source of Chebyshev's Bias.
Chebyshev's Bias (modern formulation): There are more primes of the form
$\boldsymbol{q} \boldsymbol{n}+\boldsymbol{a}$ than of the form $\boldsymbol{q} \boldsymbol{n}+\boldsymbol{b}$ if $\boldsymbol{a}$ is non-square and $\boldsymbol{b}$ is a square residue modulo $\boldsymbol{q}$.
The source and the origin of Chebyshev's Bias is the presence of the square residue $b$ among residues modulo $q$.

## DISPROVAL OF KNAPOWSKI-TURÁN CONJECTURE

Maximum percentage of values of $x \leq X$ for which $\pi_{4,1}(x)>\pi_{4,3}(x)$

- With exact formulation of Knapowski-Turán conjecture in 1962 the extensive search for $\Delta_{q, a, b}$ sign-changing zones started for various moduli and residues
- It became clear that Knapowski-Turán conjecture was false after a number breakthrough works and papers of C. Bays and R.H. Hudson (USA) who discovered several new sign-changing zones for $\Delta_{4,3,1}$ between 1979 and 1996

Empirical data supported Knapowski-Turán conjecture up to $10^{9}$ only. After Bays and Hudson research it became clear that it was wrong.

EMPIRICAL RESULTS: 1957-1996 ( $q=3,4 \& 8$ )
Status of $\Delta_{q, a, b}(x)$ sign-changing zones search from 1957 to 1996

| $\underline{1}$ | \# | b | a | Beginning | Discovered |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 3 | 1 | 1 | 2 | 608,981,813,029 | Bays \& Hudson, 1978 |
| 4 | 1 | 1 | 3 | 26,861 | Leech, 1957 |
| 4 | 2 | 1 | 3 | 616,841 | Leech, 1957 |
| 4 | 3 | 1 | 3 | 12,306,137 | Lehmer, 1969 |
| 4 | 4 | 1 | 3 | 951,784,481 | Lehmer, 1969 |
| 4 | 5 | 1 | 3 | 6,309,280,709 | Bays \& Hudson, 1979 |
| 4 | 6 | 1 | 3 | 18,465,126,293 | Bays \& Hudson, 1979 |
| 4 | 7 | 1 | 3 | 1,488,478,427,089 | Bays \& Hudson, 1996 |
| 8 | 1 | 1 | 3 | Not known up to $10{ }^{12}$ | Not discovered |
| 8 | 1 | 1 | 5 | 588,067,889 | Bays \& Hudson, 1979 |
| 8 | 2 | 1 | 5 | 35,615,130,497 | Bays \& Hudson, 1979 |
| 8 | 1 | 1 | 7 | Not known up to $10{ }^{12}$ | Not discovered |

- The search for new zones had been very slow - sometimes decades passed between the discoveries
- Several outstanding mathematicians such as J. Leech ("Leech lattice"), D.H. Lehmer ("Lucas-Lehmer primality test") and C. Bays \& R.H. Hudson (prime number research and estimates for "Skewes number") contributed greatly to the search
- Most sign-changing zones (7) were found for $\boldsymbol{4}_{4,3,1}$

There had been extensive search for 4 sign-changing zones up to $10^{12}$ from 1957 to 1996.

EMPIRICAL RESULTS: 1957-1996 ( $q=12$ \& 24)
Status of $\Delta_{q, a, b}(x)$ sign-changing zones search from 1957 to 1996

| q | \# | b | a | Beginning | Discovered |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 12 | 1 | 1 | 5 | Not known up to $10^{12}$ | Not discovered |  |
| 12 | 1 | 1 | 7 | Not known up to $10^{12}$ | Not discovered |  |
| 12 | 1 | 1 | 11 | Not known up to $10^{12}$ | Not discovered |  |
| 24 | 1 | 1 | 5 | Not known up to $10^{12}$ | Not discovered |  |
| 24 | 1 | 1 | 7 | Not known up to $10^{12}$ | Not discovered |  |
| 24 | 1 | 1 | 11 | Not known up to $10^{12}$ | Not discovered |  |
| 24 | 1 | 1 | 13 | «Around $10^{12}$ 》 | Bays \& Hudson, 1978 | Not defined exactly |
| 24 | 1 | 1 | 17 | Not known up to $10^{12}$ | Not discovered |  |
| 24 | 1 | 1 | 19 | Not known up to $10^{12}$ | Not discovered |  |
| 24 | 1 | 1 | 23 | Not known up to $10^{12}$ | Not discovered |  |

- Apart from $\Delta_{24,13,1}$ there had been no other found $\Delta$ sign-changing zones for $q=12$ \& 24
- For $\Delta_{24,13,1}$ the first zone was defined only approximately without exact boundaries and number of terms

Mod 12 and 24 presented a major problem as there had been almost nothing discovered and known about them.

## EMPIRICAL RESULTS: 1996-2016

Status of $\Delta q, a, b(x)$ sign-changing zones search from 1996 to 2016

| q | $\#$ | b | a | Beginning | Discovered |  |
| :--- | :--- | :--- | :--- | :---: | :--- | :--- |
| $\mathbf{3}$ | 2 | 1 | 2 | $6,148,171,711,663$ | Johnson, 2011 | Found with mistakes |
| $\mathbf{8}$ | 1 | 1 | 7 | $192,252,423,729,713$ | Martin, 2016 | Only first point found |

- New zones were discovered quite rarely
- The range beyond $10^{12}$ was beyond the technical capabilities for a long time
- Both Johnson and Martin were programmers, not mathematicians
- "Practice Is the Sole Criterion of Truth": no theoretical model would ever disprove the numerically confirmed $\Delta_{q, a, b}$ sign-changing zones
- Direct numerical calculations for $\Delta_{q, a, b}$ sign-changing zones have absolute accuracy

In 20+ years since 1996 there have been only two sign-changing zones found, although with incomplete or inaccurate information.

## LOGARITHMIC DENSITY/PROBABILITY OF $\pi_{4,3}(x)>\pi_{4,1}(x)$

Theorem (Rubinstein and Sarnak, 1994). As $X \rightarrow \infty$,

$$
\frac{1}{\log X} \sum_{\substack{x \leq X \\ \pi_{4,3}(x)>\pi_{4,1}(x)}} \frac{1}{x} \rightarrow 0.9959 \ldots
$$

In other words, Chebyshev was right $99.59 \%$ of the time!

Theorem (Rubinstein and Sarnak, 1994) Let $(a ; q)=(b ; q)=1$ such that $a \neq b \bmod q$. The logarithmic density

$$
\delta(q ; a, b):=\lim _{X \rightarrow \infty} \frac{1}{\log X} \int_{\substack{t \in[2, X] \\ \pi(t ; q, a)>\pi(t ; q, b)}} \frac{d t}{t}
$$

exists and is positive.

In 1994 the existence of positive logarithmic density, for 4 , meaning "the probability that $\pi_{q, a}(x)>\pi_{q, b}(x)$ " was proved.

## THE MOST "UNFAIR PRIME NUMBER RACES"

The "most unfair prime number races" (Fiorilli \& Martin) \& status (2013)

| $\#$ | q | b | a | $\delta(\mathrm{q}: \mathrm{a}, \mathbf{1})$ | Status (2013) |
| :--- | :--- | :--- | :--- | :--- | :--- |
| $\mathbf{1}$ | 24 | 1 | 5 | 0.999988 | Not found up to $10^{12}$ |
| $\mathbf{2}$ | 24 | 1 | 11 | 0.999983 | Not found up to $10^{12}$ |
| $\mathbf{3}$ | 12 | 1 | 11 | 0.999977 | Not found up to $10^{12}$ |
| $\mathbf{4}$ | 24 | 1 | 23 | 0.999889 | Not found up to $10^{12}$ |
| $\mathbf{5}$ | 24 | 1 | $\mathbf{7}$ | 0.999834 | Not found up to $10^{12}$ |
| $\mathbf{6}$ | 24 | 1 | 19 | 0.999719 | Not found up to $10^{12}$ |
| $\mathbf{7}$ | 8 | 1 | 3 | 0.999569 | Not found up to $10^{12}$ |
| $\mathbf{8}$ | 12 | 1 | 5 | 0.999206 | Not found up to $10^{12}$ |
| $\mathbf{9}$ | 24 | 1 | 17 | 0.999125 | Not found up to $10^{12}$ |
| $\mathbf{1 0}$ | 3 | 1 | 2 | 0.999063 | Known up to $10^{12}$ |
| $\mathbf{1 1}$ | 8 | 1 | 7 | 0.998939 | Not found up to $10^{12}$ |
| $\mathbf{1 2}$ | $\mathbf{2 4}$ | 1 | 13 | 0.998722 | Known up to $10^{12}$ |
| $\mathbf{1 3}$ | 12 | 1 | 7 | 0.998606 | Not found up to $10^{12}$ |
| $\mathbf{1 4}$ | 8 | 1 | 5 | 0.997395 | Known up to $10^{12}$ |
| $\mathbf{1 5}$ | $\mathbf{4}$ | 1 | 3 | 0.995928 | Known up to $10^{12}$ |

- Fundamental 2013 research by Fiorilli and Martin on logarithmic densities
- Logarithmic densities were calculated and ranked for 120 top "prime number races"
- Top 15 were selected for test within the scope of this project
Not defined exactly

In 2013 the most "unfair prime number races" were theoretically defined, 15 of which were selected for this project up to $10^{15}$.

PREDICTIONS OF NEW ZONES: $q=3,4 \& 8$
Predictions of possible $\Delta_{q, a, b}(x)$ sign-changing zones up to $10^{20}$

| q. | \# | b | a | Beginning | Made by |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{q}=3$ | 2 | 1 | 2 | $6.15 * 10^{12}$ | Bays \& Hudson, 2001 | Higck: |
| $\mathrm{q}=3$ | 3 | 1 | 2 | $3.97 * 10^{19}$ | Bays \& Hudson, 2001 |  |
| $\mathrm{q}=3$ | 3 | 1 | 2 | $3.97 * 10^{19}$ | Ford \& Hudson, 2001 |  |
| $\mathrm{q}=4$ | 8 | 1 | 3 | $9.32 * 10^{12}$ | Bays \& Hudson, 2001 | нig |
| $\mathrm{q}=4$ | 9 | 1 | 3 | $9.97 * 10^{17}$ | Deléglise, Dusart \& Roblot, 2004 |  |
| $\mathrm{q}=8$ | 1 | 1 | 3 | $6.82 * 10^{18}$ | Ford \& Hudson, 2001 |  |
| $\mathrm{q}=8$ | 1 | 1 | 5 | $1.93 * 10^{14}$ | Ford \& Hudson, 2001 | Hec |
| $\mathrm{g}=8$ | 2 | 1 | 5 | $9.32 * 10^{14}$ | Ford \& Hudson, 2001 | ніс |
| $\mathrm{g}=8$ | 1 | 1 | 7 | $1.93 * 10^{14}$ | Bays \& Hudson, 2001 | chirct |
| $\mathrm{g}=8$ | 1 | 1 | 7 | $1.93 * 10^{14}$ | Ford \& Hudson, 2001 | Hiec |

- One of the main goals of the project was to check the predictions for new sign-changing zones made in the beginning of 2000s
- Some predictions (>1018) were located far beyond the technical capabilities of that time
- Even today working above $10^{18}$ requires the use of supercomputers with many cores and efficient multi-threading

For $q=3,4$ and 8 the existence of six $\Delta$ sign-changing zones were predicted up to the $10^{15}$ - the upper boundary of the project.

PREDICTIONS OF NEW ZONES: $q=12 \& 24$
Predictions of possible $\Delta_{q, a, b}(x)$ sign-changing zones up to $10^{20}$

| $\mathbf{q}$ | \# | $\mathbf{b}$ | $\mathbf{a}$ | Beginning | Predicted by |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $\mathbf{q}=\mathbf{1 2}$ | 1 | 1 | 5 | $9.84^{*} 10^{16}$ | Ford \& Hudson, 2001 |  |
| $\mathbf{q}=\mathbf{1 2}$ | 1 | 1 | 7 | $9.78 * 10^{16}$ | Ford \& Hudson, 2001 |  |
| $\mathbf{q}=\mathbf{1 2}$ | 1 | 1 | 11 | None $<10^{20}$ | Ford \& Hudson, 2001 |  |
| $\mathbf{q}=\mathbf{2 4}$ | 1 | 1 | 5 | None $<10^{20}$ | Ford \& Hudson, 2001 |  |
| $\mathbf{q}=\mathbf{2 4}$ | 1 | 1 | 7 | None $<10^{20}$ | Ford \& Hudson, 2001 |  |
| $\mathbf{q}=\mathbf{2 4}$ | 1 | 1 | 11 | None $<10^{20}$ | Ford \& Hudson, 2001 |  |
| $\mathbf{q}=\mathbf{2 4}$ | 1 | 1 | 13 | $6.74 * 10^{14}$ | Ford \& Hudson, 2001 |  |
| $\mathbf{q}=\mathbf{2 4}$ | 1 | 1 | 17 | $6.18 * 10^{14}$ | снгск! |  |
| $\mathbf{q}=\mathbf{2 4}$ | 2 | 1 | 17 | $7.11^{*} 10^{14}$ | Ford \& Hudson, 2001 | снеск! |
| $\mathbf{q}=\mathbf{2 4}$ | 1 | 1 | 19 | $7.15^{*} 10^{14}$ | Ford \& Hudson, 2001 | снгск! |
| $\mathbf{q}=\mathbf{2 4}$ | 1 | 1 | 23 | $7.44^{*} 10^{18}$ | Ford \& Hudson, 2001 | снгск! |

- One of the main goals of the project was to check the predictions for new sign-changing zones made in the beginning of 2000 s
- The situation with $q=12$ and 24 was similar: some predictions ( $>10^{18}$ ) were located far beyond the technical capabilities of that time

For $q=12$ and 24 the existence of four $\Delta$ sign-changing zones were predicted up to the $10^{15}$ - the upper boundary of the project.

## TECHNICAL DIFFICULTIES

- Ranges above $10^{15}$ seemed incredibly high 17 years ago (in 2001) when Bays \& Hudson summarized their 25-year effort in Chebyshev's Bias area
- The direct brute-force method was extremely resource-consuming as well as sensitive to non-stop execution
- Fast and reliable prime number generators that were capable of working with large primes above $10^{12}$ and generate them without omissions and mistakes were absent
- The alternative way of getting primes - the preliminary generation with further database storage, required enormous memory size (hundreds of terabytes or even petabytes) and barely allowed to move above $10^{12}$ leaving alone $10^{15} \mathrm{up}$
- Fast and affordable servers capable to work without mistakes and non-stop 24 $\boldsymbol{x} 7$ for many weeks and months were required
- Many predicted points were located around $10^{18}$ - far above $10^{15}$, that also reduced substantially the desire for implementation
- To work above $10^{18}$ fast supercomputers with many cores and efficient multithreading were required
The direct brute force method to test Chebyshev's Bias even up to $10^{15}$ was difficult till recent advances in software and hardware development.

PROJECT TECHNICAL SET-UP

- 2 main $C++$ programs
- Primes up to $1.8 * 10^{19}$ $\left(2^{64}\right)$ could be tested
- Control C\# program with $10^{12}$ database to check
- 4 consecutive ranges to test: $10^{13}, 10^{14}, 10^{15}$, $5 * 10^{15}$
- At least 2 passes for each range and "prime number race"
- Project was extended to $10^{16}$ in May of 2018
- $5 * 10^{15}$ was reached in August 2018
- Data double-checked till November 2018
Several C++ \& C\# programs were written for the project. The fastest known prime number generator "primesieve" was used for tests.

RESULTS: $\mathbf{q}=\mathbf{3}$ (primes and values of $\mathbf{n}$ for primes)
Sign-changing zones for $q=3$ : primes

| q | № | b | a | Beginning | End | \# $\Delta$ = -1 | OEIS |  |  |

- Second zone matched exactly with that predicted by Bays \& Hudson (2001) at $6.15 * 10^{12}$
- New A297006 and A297005 sequences were registered with OEIS

For $q=3$ the $2^{\text {nd }} \Delta$ sign-changing zone was found that almost exactly matched a zone predicted back in 2001.

RESULTS: $q=4$ (primes)
Sign-changing zones for $q=4$ : primes

- The $8^{\text {th }}$ zone happened lower than was predicted by Bays \& Hudson (2001) at $9.32 * 10^{12}$
- The $9^{\text {th }} \& 10^{\text {th }}$ zones were not expected up to $10^{18}$
- OEIS sequence A051025 with only 30 terms was complemented and now includes 913,497 terms
For $q=4$ three new zones $\left(8^{\text {th }}, 9^{\text {th }} \& 10^{\text {th }}\right)$ were discovered. According to the theoretical models the last two had not been expected below10 ${ }^{18}$.

RESULTS: $\mathbf{q}=4$ (values of $\mathbf{n}$ for primes)
Sign-changing zones for $q=4$ : values of $n$ for primes ( $\pi(x)$ function)

- Not a single zone discovered for $\Delta_{12,1,1}(x)$
- Discovered zone for $\Delta_{12,5,1}(x)$ happened to be narrow and lower than predicted at $9.84 * 10^{16}$
- Discovered zone for $\Delta_{12,7,1}(x)$ happened to be narrow and lower than predicted at $9.78 * 10^{16}$
- Four new OEIS sequences were registered A297355, A297354, A297357 and A297356

In $5 * 10^{15}$ range theoretical models failed to predict both discovered zones unknown before. This requires explanation and change in the models!

RESULTS: $q=24$ (primes)
Sign-changing zones for $q=24$ : primes

- Six new OEIS sequences were registered A295356, A295355, A297450, A297449, A298821 and A298820
For $q=2413$ new zones were discovered for $\Delta_{24,13,1}(x), \Delta_{24,17,1}(x)$ and $\Delta_{24,19,1}(x)$. None were found for $\Delta_{24,5,1}(x), \Delta_{24,7,1}(x), \Delta_{24,11,1}(x) \& \Delta_{24,23,1}(x)$.

RESULTS: $q=24$ (values of $\mathbf{n}$ for primes)
Sign-changing zones for $q=24$ : values of $n(\pi(x)$ function)

- 6 sequences registered A295356, A295355, A297450, A297449, A298821 \& A298820

For $q=2413$ new zones were discovered for $\Delta_{24,13,1}(x), \Delta_{24,17,1}(x)$ and $\Delta_{24,19,1}(x)$. None were found for $\Delta_{24,5,1}(x), \Delta_{24,7,1}(x), \Delta_{24,11,1}(x) \& \Delta_{24,23,1}(x)$.

RESULTS
The most "unfair prime number races" - the largest $\delta(q ; a, 1)$ and status as of 2018

| $\#$ | q | b | a | $\delta(q ; a, 1)$ | Status (2018) |
| :--- | :--- | :--- | :--- | :--- | :--- |
| $\mathbf{1}$ | 24 | 1 | 5 | 0.999988 | Not found up to $5^{*} 10^{15}(2018)$ |
| $\mathbf{2}$ | 24 | 1 | 11 | 0.999983 | Not found up to $5^{*} 10^{15}(2018)$ |
| $\mathbf{3}$ | 12 | 1 | 11 | 0.999977 | Not found up to $5^{*} 10^{15}(2018)$ |
| $\mathbf{4}$ | 24 | 1 | 23 | 0.999889 | Not found up to $5^{*} 10^{15}(2018)$ |
| $\mathbf{5}$ | 24 | 1 | 7 | 0.999834 | Not found up to $5^{*} 10^{15}(2018)$ |
| $\mathbf{6}$ | 24 | 1 | 19 | 0.999719 | Found up to $5^{*} 10^{15}(2018)$ |
| 7 | 8 | 1 | 3 | 0.999569 | Not found up to $5^{*} 10^{15}(2018)$ |
| $\mathbf{8}$ | 12 | 1 | 5 | 0.999206 | Found up to $5^{*} 10^{15}(2018)$ |
| $\mathbf{9}$ | 24 | 1 | 17 | 0.999125 | Found up to $5^{*} 10^{15}(2018)$ |
| $\mathbf{1 0}$ | 3 | 1 | 2 | 0.999063 | Known up to $5^{*} 10^{15}(2018)$ |
| 11 | 8 | 1 | 7 | 0.998939 | Found up to $5^{*} 10^{15}(2018)$ |
| $\mathbf{1 2}$ | 24 | 1 | 13 | 0.998722 | Known up to $5^{*} 10^{15}(2018)$ |
| $\mathbf{1 3}$ | 12 | 1 | 7 | 0.998606 | Found up to $5^{*} 10^{15}(2018)$ |
| $\mathbf{1 4}$ | 8 | 1 | 5 | 0.997395 | Known up to $5^{*} 10^{15}(2018)$ |
| $\mathbf{1 5}$ | 4 | 1 | 3 | 0.995928 | Known up to $5^{*} 10^{15}(2018)$ |

- Discovered 4 first ever zones $\left(\Delta_{12,5,1}(x), \Delta_{12,7,1}(x), \Delta_{24,17,1}(x), \Delta_{24,19,1}(x)\right)$ for 4 out of 15 most interesting and "unfair prime number races"
- In total 25 new $\Delta_{q, a, b}(x)$ sign-changing zones discovered
- In total 18 sequences were registered or substantially extended with OEIS
- Sign-changing zones for only 6 "most unfair prime number races" remain unknown Project implementation allowed to advance substantially in search for $\Delta$ sign-changing zones for the most interested "prime number races".

## RESULTS: PUBLISHED DATA

A297006: $\mathbf{p}(\mathbf{x})\left\{\Delta_{3,2,1}(\mathbf{x})=-1\right\}$

A297354: $\boldsymbol{\pi}(\mathrm{x})\left\{\Delta_{12,5,1}(\mathrm{x})=-1\right\}$

A297448: $p(x)\left\{\Delta_{8,5,1}(x)=-1\right\} \quad \mathbf{A 2 9 5 3 5 4}: p(x)\left\{\Delta_{8,7,1}(x)=-1\right\}$

A297355: $p(x)\left\{\Delta_{12,5,1}(x)=-1\right\}$

A297356: $\pi(x)\left\{\Delta_{12,7,1}(x)=-1\right\} \quad$ A295355: $\pi(x)\left\{\Delta_{24,13,1}(x)=-1\right\} \quad$ A297449: $\pi(x)\left\{\Delta_{24,17,1}(x)=-1\right\} \quad$ A298820: $\pi(x)\left\{\Delta_{24,19,1}(x)=-1\right\}$

A297357: $\mathbf{p}(\mathbf{x})\left\{\Delta_{12,7,1}(\mathbf{x})=-1\right\}$

All data were published in The Online Encyclopedia of Integer Sequences (OEIS) as 18 separate sequences.

## RESULTS: PUBLISHED DATA

All results are available at project repository at www.math101.guru (http://math101.guru/en/downloads-2/repository).

## RESULTS: CONCLUSIONS

- Chebyshev's Bias was tested up to $\mathbf{5 * 1 0}{ }^{15}$ for selected 15 "most biased prime number races", established theoretically in 2013
- First sign-changing zones were discovered for 4 "most biased prime number races" out of selected 15 ( 6 still remain unknown)
- In total, 25 new sign-changing zones for delta were found
- It was confirmed that theoretical models fail to predict small and narrow zones that occur more frequently than assumed
- It was confirmed that theoretical models predict big and wide zones relatively well
- 18 sequences were registered or substantially extended with OEIS
- All zones were accurately and exactly defined (beginning, end, number of terms)
- Full and complete data are available to everybody
- Created software allows to test Chebyshev's Bias up to $2^{64}\left(1.8^{* 1} 0^{19}\right)$
- The article is under work for submission to «Mathematics of Computation»
Project implementation allowed to extend substantially our knowledge on Chebyshev's Bias and define the accuracy of theoretical models.
